

MS DryCare Plus: farrowing department protocol

■ Before farrowing:

During the cleaning process of the farrowing pen, the risk of infection is spread around the unit, which is why reducing the risk of infection is both deadly and inhibiting to pathogens. Scatter MS DryCare Plus after wash for desiccation and disinfection, before the animals enter the farrowing pen.

Please apply:

- Max. 100 grams per square meter
- Max. 9.2 grams per square foot
- Max. 3.2 oz. per 10.5 square feet
- Max. 2 lb. per 100 sq. ft. ~ All are comparable measurements

■ During farrowing:

MS DryCare Plus is a drying agent for piglets used within the first few minutes after birth.

Drying the piglets prevents them from getting cold and thereby not having the necessary energy to reach the sow's teats. It's well known that building up a strong passive immunity through the maternal colostrum is of utmost importance for the survival of the piglet.

Rub the just born piglets with MS DryCare Plus and specifically rub the umbilical cord with MS DryCare Plus. Place the piglet on the heated mat after treatment.

■ After farrowing:

It's recommended to use MS DryCare Plus for 3-4 consecutive days after farrowing to decrease pathogen pressure and reduce the risk of infections significantly.

Please apply:

- Max. 100 grams per square meter
- Max. 9.2 grams per square foot
- Max. 3.2 oz. per 10.5 square feet
- Max. 2 lb. per 100 sq. ft. ~ All are comparable measurements

NOTE: Due to its superb absorbing power it's NOT recommended to use more than the above prescribed dosages to prevent the powder to clot. In case of clotting: clotted powder will eventually dry up and fall apart and start absorbing again.
