

Bird Gard®

The World Leader in Electronic Bird Control

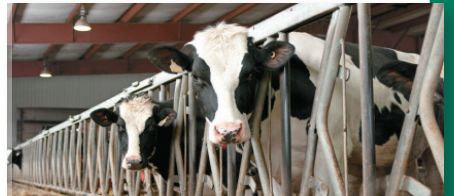

Bird Gard uses a birds' primal fears and natural survival instincts to repel them. Digital recordings of species specific distress and alarm calls, along with the sounds of their natural predators are broadcast through high fidelity weather-resistant speakers to convince birds they are under attack. A microprocessor controls the direction, duration, and timing of sounds to give the impression that danger is all around. Sophisticated random technology keeps birds from getting used to the sounds. Birds act like they are hitting a wall and immediately change direction when they come in range of Bird Gard.

All Bird Gard units feature solid-state electronics and weather-resistant housings for years of dependable operation in any weather condition. All units can be powered by either 12VDC or 110/220VAC.

Ideal for:

- Vineyards
- Orchards
- Crops
- Farms
- Barns
- Livestock operations
- Dairies
- Yards and gardens
- Warehouses
- Buildings
- Airports
- Hangers
- Power stations
- Fish farms
- Marinas and boats
- Landfills

Chateau Le Maul Vineyard and Winery, Valley Springs, California

*I installed your Bird Gard in my 100 year old vineyard last year and the device easily **increased crop yield by 50%**. Bird damage, which in previous years was mild to severe, became negligible.*

Thanks again for supplying a product that works.
