

Vink Calfpuller

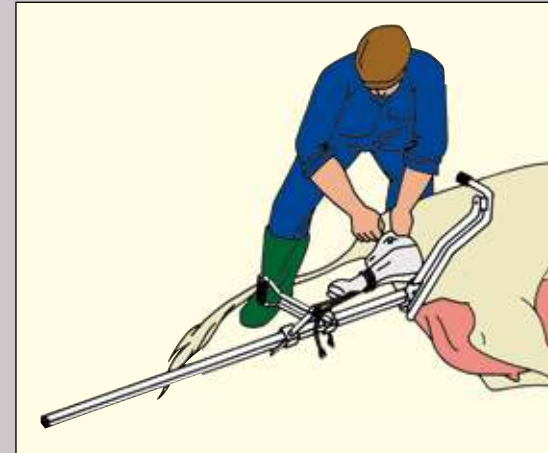

The Vink calfpuller has a very functional design, is wholly constructed in stainless steel, very robust and practically indestructible which ensures a long and trouble-free service.

The Vink calfpuller has some important advantages:

- Impossible to slip away from the cow
- The only single handed calfpuller
- It permits pulling tension straight, upwards and also in the direction of the udder.

**New
Alternate traction**

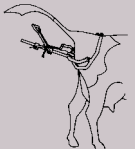

A normal delivery requires a pull of 150-250 kg. A stronger pull may cause damage to cow, calf or apparatus. The pole can be moved sideways maximum 30 degrees, a move sideways of more than 30 degrees can damage the apparatus. Always take care to ensure sufficient room around the cow during the delivery, this renders a sideways movement of the pole unnecessary.

During a normal presentation, one should draw downwards.

In case of a posterior presentation the draw should be upwards, then in the direction of the udder.

Vink Calfpuller for beef

This more robust calfpuller enables more traction. Only available with alternate traction
